

Job Search Incentives and Job Match Quality

Simen Gaure, Knut Røed and Lars Westlie

Complete estimation results for an alternative model with incentive effects interacted with liquidity constraints

Existing empirical evidence indicates that the behavioral impacts of UI insurance depend on the prevalence of liquidity constraints (Chetty, 2008). For a large fraction of unemployment entrants in our dataset (those entering after 1994), we have register-based information on job-seekers' own, as well as their family members', bank accounts at the end of the year prior to the year of entry into unemployment. We define liquidity as the sum of the family account balances divided by the square root of the number of family members. We then divide the analysis population in two equally sized groups; those with liquidity above the median and those with liquidity below the median. This appendix presents the estimation results from a model where all incentive and duration dependence parameters are allowed to vary between these two groups. Apart from that, the model is identical to the one presented in the paper.

Complete variable description is provided in a separate downloadable file. The numbers at the end of each variable indicate the event (destination) in question: employment (_1), education (_2), another benefit (_3), ALMP (_4), employment termination (_5) and earnings (_6). In the table below, all estimates shared between the groups of constrained and non-constrained individuals are left blank for the liquidity constraints group.

Not all variables are included in all hazard rates. For instance, the model does not allow participants in ALMP to enter into a new program while already participating. Therefore, the "on ALMP" dummies are excluded from this hazard rate. Persons older than 34 years old are assumed to have a zero risk of entering education (a very few do, and these are treated as censored).

Our reading of the results presented below are as follows: The most important differences between the two groups are; first, that the transition rate to other benefits is significantly

higher for job seekers with poor liquidity; second, that liquidity-constrained individuals exhibit stronger negative duration dependence in the hazard rate to employment; and third, that these individuals also lose a subsequent job much faster than non-constrained individuals. These findings may reflect that poor liquidity actually results from weak labor market attachment in the past, which is also associated with rapid discouragement and high exit probability through other benefits. We find no evidence that job seekers with poor liquidity responded particularly strongly to UI exhaustion or to the UI reform in 1997.

The complete estimation results of the alternative model with liquidity constraints

Employment	No Liquidity constraints			Liquidity constraints
